Adding a New Blog Post to the Website

A simple, no-coding-required walkthrough for publishing a blog article using Claude — just bring your finished write-up.

No coding needed

~5 minutes

Nothing goes live without your OK

Keep this PDF handy — you'll follow the same steps every time you add a new post.

1 What You'll Need

- ✓ Your finished article, saved as a file — a Word document (.docx), a PDF, or even a plain text/notes file. Anywhere on your computer is fine (Desktop is easiest to find later).
- ✓ The project already open in Claude Code on your computer. If you're not sure how to open it, ask your developer to show you once — it's the same two steps every time.
- ✓ That's it. You don't need to touch any code, images, or website files yourself.

2 Open Claude Code

1. Open the **Terminal** app on your Mac.
2. Go to the website project folder. If your developer gave you the folder path, type `cd`, then a space, then drag the project folder from Finder into the Terminal window — it will fill in the path for you. Press Enter.
3. Type `c l a u d e` and press Enter. Wait a few seconds for it to start.

Tip: once it's running, you just type in plain English — like texting. No commands to memorize.

3 The Step-by-Step Walkthrough

STEP 1 Tell Claude to add your blog post

Type this, then either drag your article file into the Terminal window (it fills in the file path automatically) or type the path yourself:

COPY THIS PROMPT

Add this as a new blog post: [drag your file here]

Press Enter. Claude will read the whole document on its own.

STEP 2 Claude checks in with a couple of quick questions

You don't need to know anything technical to answer — just reply the way you'd answer a colleague.

CLAUDE

I found a cover photo that matches the topic — here it is. Does this work, or should I try a different one?

YOU

That one looks good, use it

CLAUDE

Got it. I also noticed the article fits best under "Relationships" — sound right?

YOU

Yes that's right

If a suggested photo doesn't feel right, just say so — Claude will search again or you can supply your own image.

STEP 3 Preview it before anything is public

Claude will tell you the post is ready and give you a page link to preview it on your own computer, e.g. a "blog/your-post-name" address. Nothing is visible to website visitors yet — this is just for you to check.

STEP 4 Ask for any changes

Reading it over and want a tweak? Just say what you'd change, in plain English — see the phrase list on the next page for examples.

STEP 5 Publish when you're happy

This is a deliberate safety step: Claude will **never** make your changes public on its own. Once you're happy with the post, tell Claude you're ready to save the changes, and let your developer know so they can push it live on the real website.

4 Handy Phrases to Use

You can copy these directly, or just say something similar in your own words.

Start a new blog post from a file	Add this as a new blog post: [drag file in]
Start from text you paste in, no file	Add a new blog post, here's the text: [paste article]
Don't like the suggested photo	Try a different cover photo, something less literal
Want to supply your own photo	Use this image instead: [drag your photo in]
Fix a typo or wording	Fix the typo in the third paragraph – it should say "therapist"
Change the category	Move this post to the ADHD category instead
Shorten something	Make the summary a bit shorter
See it before publishing	Show me a preview link for this post

5 Common Questions

Do I need to know anything about code, HTML, or websites?

No. Claude handles all of the technical parts — formatting, the cover photo, page setup. You just supply the article and answer plain-English questions.

What if I don't know the exact file location on my computer?

You don't need to type it. Drag the file from Finder straight into the Terminal window and the path fills in automatically.

Can I write the post directly in the chat instead of uploading a file?

Yes — just paste the text of your article after asking Claude to add a new blog post.

What if I don't like the photo it picked?

Claude will always show you the photo and ask before finalizing it. Say "try another one" and it will search again, or send your own image to use instead.

Can I break the website by making a mistake?

No. Nothing goes live until you and your developer deliberately publish it. Feel free to try things, ask for changes, or start over.

Who do I ask if something isn't working?

Reach out to your developer — they can check the setup or make sure Claude Code is installed correctly.
